

Analog Signal Interpolation

Jishnu Bhattacharjee, Debanjan Mukherjee, & Abhijit Phanse

ABSTRACT

A linear interpolator is provided that includes differential pairs of transistors biased such that a first input voltage may be multiplied by a factor r wherein $0 \leq r \leq 1$ and such that a second input voltage may be multiplied by the complement factor $(1-r)$. By combining the multiplied input voltages, a linear interpolation is provided based upon the factor r .
